## Lepocinclis hispidula

## (Eichwald) Daday, 1905

Most likely ID: n.a.

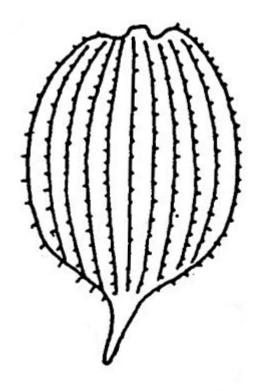

Synonyms: Phacus hispidulus, Phacus suecicus var. latus, Phacus horridus, Phacus hystrix, Phacus latus, Phacus glaber, Phacus papillaris, Lepocinclis horrida

**Sampling location:** Simmelried

Phylogenetic tree: Lepocinclis hispidula

## **Diagnosis:**

- cells ovoid or obovoid
- length 39-55 μm, width 20-25 μm
- conical shaped apex
- flagellum shorther than cell
- numerous chloroplasts, disc-shaped
- pellicle with longitudinal rows of fine spines
- base of spines almost squared

after Popova

## Lepocinclis hispidula

I've only been finding *Lepocinclis hispidula* in the <u>Simmelried</u> since 2019. Since then I find the species there regularly. Before that, I have no records and Lepocinclis hispidula is not present in my other sampling sites either.

The species was originally described as *Phacus hispidulus* (Lemmermann, 1910). In 2012, Phacus hispidulus was then transferred to the genus Lepocinclis by Bennet & Triemer on the basis of genetic analyses, together with some other *Phacus* species (e.g. *Phacus* horridus, s. "Synonyms" above).

Lepocinclis hispidula is easily recognized by its longitudinal rows of short spines on the pellicle (s. fig. 1 a-c). These have an almost square and rectangular base (s. fig. 4). In addition, the species has a conically shaped apex from which the flagellum originates. Many disc-shaped chloroplasts can be seen in the cell (s. fig. 1 b). Two large paramylon grains are said to be present, but I was unable to detect them. The cell wall of my specimens was either colorless or slightly yellow-brown in color. In my population I also found specimens with only a few rows of rudimentary spines (s. fig. 2 a-c). It is possible that these are daughter cells after a division has taken place.

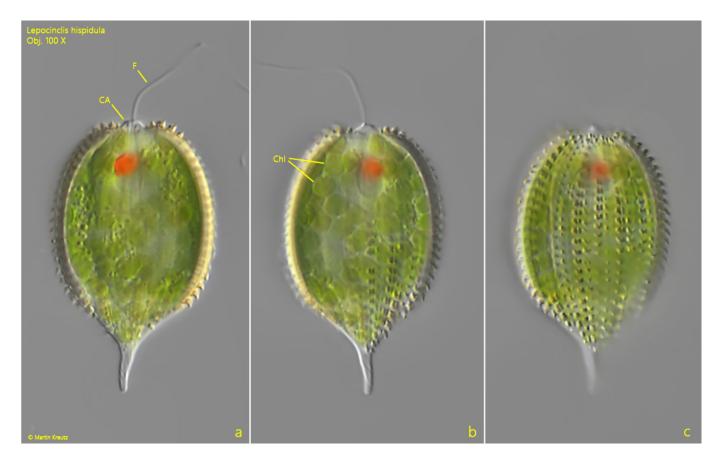

Fig. 1 a-c: Lepocinclis hispidula. L =  $40~\mu m$ . Different focal planes of a freely swimming specimen. Note the cone-shaped apex (CA) where the flagellum (F) emerge. Chl = discshaped chloroplasts. Obj. 100 X.

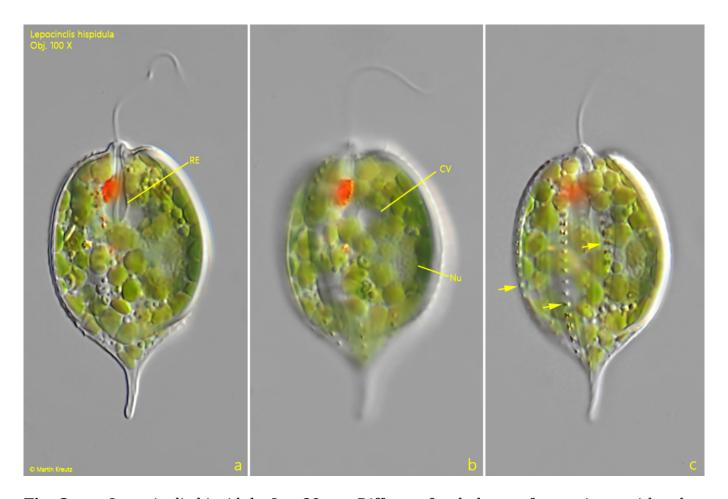

Fig. 2 a-c: Lepocinclis hispidula. L = 38  $\mu m$ . Different focal planes of a specimen with only few rows of rudimentary spines (arrows). CV = contractile vacuole, Nu = nucleus, RE = contractile vacuolereservoir. Obj. 100 X.

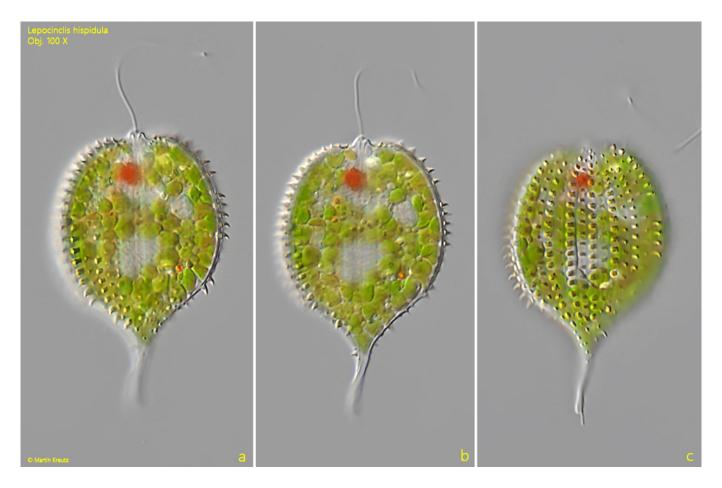

Fig. 3 a-c: Lepocinclis hispidula. L =  $46~\mu m$ . A third, freely swimming specimen. Obj. 100~X.

Fig. 4: Lepocinclis hispidula. L = 45  $\mu m$ . A slightly squashed specimen with focal plane on the almost squared base of short spines. Obj. 100 X.
